with funding from the

Strategic Prevention Framework - Partnerships for Success Program
Introduction:
The Role of the Delaware State Epidemiological Outcomes Workgroup and the Purpose of the Epidemiological Profile

All states, including Delaware, have received support from the Substance Abuse and Mental Health Services Administration's (SAMHSA) Center for Substance Abuse Prevention (CSAP) to establish a Statewide Epidemiological Outcomes Workgroup (SEOW). Some SEOWs, including Delaware’s, are incorporated as part of a SAMHSA Strategic Prevention Framework-State Incentive Grant (SPF-SIG) or Strategic Prevention Framework-Partnerships for Success (SPF-PFS) grant. The Division of Substance Abuse and Mental Health (DSAMH) in the Delaware Health and Social Services has been the recipient of an SPF-SIG grant and, more recently, of a SPF-PFS grant. The SEOW is a group of people and organizations in the state that have and use analytical data concerning drug and alcohol use and abuse and related behaviors and consequences; this information can be used to establish and monitor indicators related to substance abuse prevention. Formerly known as the Delaware Drug and Alcohol Tracking Alliance (DDATA), Delaware’s SEOW mission is to bring data on substance abuse and related behavioral problems to the forefront of the prevention planning process by pursuing the following goals:

- To build monitoring and surveillance systems to identify, analyze, and profile data from state and local sources
- To provide current benchmarks, trends, and patterns of substance abuse consumption and consequences
- To create data-guided products that inform prevention planning and policies
- To train agencies and communities in understanding, using, and presenting data effectively

This report, the Delaware State Epidemiological Profile, was developed by the SEOW to disseminate data for strategic planning, decision-making, and evaluation. Using indicators that are available on an ongoing basis, the report briefly describes Delaware-specific patterns of consumption, context, consequences, and trends of substance use, especially among young people.

Chapter 12 covers lesbian, gay, bisexual, and questioning youth in Delaware. To review the complete Delaware Epidemiological Profile, other chapters, or SEOW data products, please visit the UD Center for Drug and Health Studies Delaware Epidemiological Reports page.
Thank you for your participation and commitment to data-driven prevention planning, practice, and evaluation! We are especially grateful for the support from Director Elizabeth Romero and the team at the Delaware Division of Substance Abuse and Mental Health for their guidance and collaboration.

Delaware State Epidemiological Profile Overview

Each year, the Center for Drug and Health Studies at the University of Delaware, the facilitator of the State Epidemiological Outcomes Workgroup (SEOW), releases the Delaware State Epidemiological Profile, a project funded under the federal Strategic Prevention Framework-Partnerships for Success initiative. This report (2019) highlights the most recently available data on substance use among various populations across both Delaware and nationwide. Its information is intended to help decision-makers and stakeholders across the state accomplish goals related to needs assessments, strategic planning, and evaluation.

In its entirety, this report includes the following chapters:

1. State Demographic Background
2. Tobacco and Electronic Cigarettes
3. Alcohol
4. Marijuana
5. Opioid Use and Other Trends
6. Other Illegal Drugs
7. Substance-Exposed Infants
8. Gambling
9. Mental Health
10. Persons with Disabilities (new to the report this year)
11. Adverse Childhood Experiences
12. Lesbian, Gay, Bisexual, and Questioning Youth
13. Transgender Youth
14. Protective Factors
Chapter 12: Lesbian, Gay, Bisexual, and Questioning Youth

National Overview

Data at the national level shows patterns of health disparity in the lesbian, gay, bisexual, and questioning (LGBQ) youth community. One meta-analysis and review found that on average, LGBQ youth were 190% more likely to misuse substances than heterosexual youth (Marshal et al., 2008). Another meta-analysis found significantly higher rates of depression and suicidal ideation for sexual minority youth compared to other youth (Marshal et al., 2011). These studies suggest that victimization, discrimination, and the stress associated with both may be risk factors for both substance abuse and poor mental health status among LGBQ youth individuals.

Delaware Overview

Eleven percent of Delaware high school youth who responded to a 2017 Youth Risk Behavior Survey (YRBS) question about sexual orientation reported that they identified as lesbian, gay, or bisexual. An additional three percent indicated that they were not sure of their sexual orientation (Q or questioning). Compared to data from the 2015 YRBS, it appears the gap is narrowing across several measures; however, LGBQ youth continue to appear to be at disproportionate risk for negative psychosocial concerns. This population reported increased rates of substance use and poorer mental health than their heterosexual peers. It is important to note that being gay, lesbian, or bisexual is not the cause of increased risk behaviors; rather, internal and interpersonal conflicts very likely contribute to the heightened risk that these teens experience. Uncertainty may create even greater challenges, as the following slides illustrate that the youth who report that they unsure of their sexual orientation report highest rates of smoking cigarettes, binge drinking, and the use of numerous illegal drugs.

In terms of mental health, more than half of LGBQ youth (52.5%) reported feeling sad or hopeless for two weeks or more in the preceding year. They reported higher rates of always worrying and feeling afraid than their straight peers. LGBQ youth are at elevated risk for self-harm and suicide comparatively. Almost 39% of LGBQ youth purposefully hurt themselves (without intending death) at least once in the last year compared to 10% of heterosexual youth. Further, 30.6% of LGBQ youth planned suicide and 18% attempted suicide at least once within the last year, as opposed to nine and five percent respectively among their heterosexual peers.

Strategies to prevent substance use disorders and mental illness are designed to increase protective factors and reduce risk factors. Risk and protective factors are relevant across several domains (individual, family, peers, and communities) and during various stages of the life cycle. Data from the YRBS show two domains where sexual minority youth in Delaware have increased risk factors: LGBQ youth reported poorer relationships with their parents than other youth and increased rates of bullying victimization. Data from the 2017 Delaware YRBS show that across the entire student population, students who report positive relationships with their parents have lower rates of substance abuse and better mental health status (see Chapter 14 in
In this instrument, positive parental relationships are measured by youths’ perceived parental pride, parental interest in youth activities, and comfort in sharing thoughts and feelings with parents. As the following charts illustrate, straight teens reported higher rates of parental support compared to their LGBQ peers. LGBQ youth were more likely to report that they avoided going to school due to feeling unsafe and were bullied (on school property and electronically) at rates approximately twice that of their heterosexual peers. Additionally, LGBQ youth reported they were more likely to bring a weapon to school at least once within the last 30 days (6.3%), compared to 2.9% among heterosexual youth.

Data from the Delaware YRBS show LGBQ students report significantly higher rates of past-month use of cigarette, alcohol, marijuana, and prescription painkillers (without a prescription) compared to other students. They were more than twice as likely to report current cigarette use than their heterosexual peers. Seventeen percent of sexual minorities reported binge drinking in the past month, compared to 15% of heterosexual students. Past-month marijuana use was also higher among LGBQ youth than among their heterosexual peers (32% versus 23%). Sexual minorities reported more than twice the past-month use of prescription pain medicine (10.7%) than their heterosexual peers (4.9%). Across all drug categories, sexual minorities reported significantly higher rates of ever using drugs than heterosexual students.

The following charts depict the rates of substance use, mental health concerns, protective factors, and bullying experienced by Delaware high school students by reported sexual orientation (heterosexual, gay/lesbian, bisexual, or unsure). It is important to remember that differences in these rates are not intrinsically associated with being LGBQ but are largely due to internal and external challenges that these youth may face related to their sexual orientation. Efforts to increase parental and peer support for all students, and for this group in particular, will be essential to create prevention strategies for LGBQ youth.
